MOBILE / WEB APPLICATION DESIGN

Background Colour and Menu Customization

PROJECT REPORT

Project Title	Customizable Interface App
Platform	Mobile or Web Application
Main Features	Change background colour, customize menus, preview and save preferences

A practical UI/UX and application-design project.

• 12. Conclusion

1. INTRODUCTION

The proposed application allows users to personalize a mobile or web interface by changing its background colour and customizing menu options. Users can choose a colour, preview it immediately, select a menu style, and save their preferences. The aim is to provide a simple interface that can be personalized without technical knowledge.

2. PROBLEM STATEMENT

Many applications provide limited interface customization. Users may prefer different background colours for comfort, readability, or personal taste, and may want menus that are easier to navigate. This application brings background and menu settings into one clear customization screen.

3. OBJECTIVES

Allow users to change the application background colour.

Provide preset colours and a custom colour option.

Allow users to customize menu labels, order, and display style.

Show a live preview before applying changes.

Provide Save, Reset, and Cancel actions.

Keep text readable with sufficient contrast and accessible controls.

4. PROPOSED APPLICATION

The application contains a Home screen and a Customization screen. From Home, the user opens Settings or Customize Appearance. The customization screen includes background colour choices, menu settings, a preview panel, and buttons to apply or reset changes. The design can be implemented as a responsive web app or adapted to a mobile app.

5. MAIN FEATURES

5.1 Background Colour Selection

Users can select preset colours such as white, light blue, lavender, mint, and dark mode. A custom colour picker can allow any supported colour. The preview updates when a new colour is selected.

5.2 Menu Customization

Users can choose a menu style (top navigation, side menu, or bottom navigation), show or hide optional menu items, and reorder items where supported. Essential items such as Home and Settings should remain easy to find.

5.3 Live Preview

A preview area displays the chosen background and menu style before saving.

5.4 Save and Reset

Save applies the selected settings. Reset restores the default appearance. Cancel exits without applying unsaved changes.

6. USER FLOW

Open Application → Settings / Customize Appearance → Choose Background Colour → Customize Menu → Preview Changes → Save Preferences → Return to Home Screen.

Open Application
↓
Settings / Customize Appearance
↓
Choose Background Colour
↓
Customize Menu Items or Menu Style
↓
Preview Changes
↓
Are the changes correct?
↓
Yes → Save Preferences
↓
No → Edit Settings Again
↓
Return to Home Screen

7. INTERFACE SCREENS

Screen 1: Home Screen

• Displays the app title and main content.

• Shows the current background and navigation menu.

• Provides a clear Settings or Customize button.

Screen 2: Appearance Settings

• Displays background colour swatches and a custom colour picker.

• Shows menu layout options: top, side, or bottom navigation.

• Includes toggles for optional menu items.

Screen 3: Live Preview

• Shows the selected background colour and chosen menu style.

• Lets users check text readability and menu visibility.

• Provides Save, Reset, and Cancel buttons.

Example Menu Items

• Home

• Dashboard

• My Items

• Notifications

• Profile

• Settings

8. DESIGN AND CUSTOMIZATION LOGIC

• When a colour swatch is selected, update the preview background.

• When a menu layout is selected, update the preview navigation structure.

• When an optional menu toggle changes, show or hide that item in the preview.

• When Save is pressed, apply the chosen settings to the app.

• When Reset is pressed, restore default values.

• Use accessible colour contrast for text, icons, and interactive controls.

9. TESTING PLAN

• Check that every preset background colour can be selected.

• Check that the preview updates immediately.

• Check that menu layout changes display correctly.

• Check that hidden menu items no longer appear in the preview.

• Check that Save applies the selected preferences.

• Check that Reset restores defaults.

• Test on different mobile and desktop screen sizes.

• Verify text contrast and keyboard/touch accessibility.

10. EXPECTED OUTCOME

The expected result is a simple application that allows users to change background colour and customize menus through a clear settings page. Live preview makes changes easy to understand, while Save and Reset controls keep the experience predictable.

11. FUTURE ENHANCEMENTS

• Add light, dark, and high-contrast themes.

• Allow users to save multiple themes.

• Add font size and text style customization.

• Support drag-and-drop menu ordering.

• Synchronize preferences across devices after secure account login.

12. CONCLUSION

The Background Colour and Menu Customization App demonstrates how interface personalization can be made simple and accessible. By combining colour selection, menu customization, live preview, and preference controls, the application gives users greater control over appearance and navigation.

PROJECT SUMMARY

Input	User-selected background colour and menu settings
Process	Preview, check readability, and save preferences
Output	A personalized mobile or web interface
